1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 05/05/08 has been entered.

Reasons for Allowance

2. The following is an examiner's statement of reasons for allowance: In Response to the final office action, dated February 5, 2008, further in view of applicant's amendments filed on 05/05/08, the application has been carefully reviewed and respectfully considered.

According to applicant's remarks based on currently amended subject matter, as discussed in page 8 through 11, has been found persuasive, the rejection has been withdrawn, and therefore, independent claims 1, 9, 37 and 31 has been allowed, for the reasons given below, including all dependent claims depend on therefrom:

With respect to claims 1-6, 8 and 24, the prior art searched and of record neither anticipates nor suggests the claimed invention as amended. In particular, a scanning method, comprising: moving a scan head along a first scanning direction to obtain a preview_image using first scanning resolution; display the review image moving said scan head along a second scanning direction to obtain a high resolution image said using a second scanning resolution that is higher than the first scanning resolution; receiving input corresponding to a selected portion of the preview image and a requested scanning resolution for a desired output image; and operating on said high resolution image to become a generate said output image at the requested scanning resolution and corresponding to said selected portion of the preview image.

Further, regarding to claims 9-19 and 25, the prior art searched and of record neither anticipates nor suggests the claimed invention as amended, which is scanning method, comprising: moving a scan head along a first scanning direction to proceed with a first scanning procedure using a first scanning resolution, wherein a first image is obtained from said first scanning procedure; displaying said first image as a preview image; moving said scan head along a second scanning direction to proceed with a second scanning procedure using a second scanning resolution wherein a second image is obtained from said second scanning procedure; receiving input corresponding to a user-selected portion of said preview image and a user-selected third scanning resolution; and operating on said second image to generate a third image at said third scanning resolution and corresponding to said user-selected portion of said preview

image wherein said third image is generated without further movement of said scan head.

As to claims 27-30, claims are allowed for the reasons the prior art searched and of record neither anticipates nor suggests the claimed invention as amended, A system, comprising: means for moving a scan head along a first scanning direction to proceed with a first scanning procedure using a first scanning resolution, wherein a first image is obtained from said first scanning procedure; means for moving said scan head along a second scanning direction to proceed with a second scanning procedure in a second scanning resolution which is higher than said first scanning resolution , wherein a second image is obtained from said second scanning procedure; means for selecting a portion of said first image means for selecting resolution; and means for said second image to obtain a third image to the selected portion of said first image and the selected out put resolution and wherein said first scanning direction is generally opposite to said second scanning direction.

Finally, claims 31-35, also allowed for the reasons the prior art searched and of record neither anticipates nor suggests a system, comprising: a scan head configured to perform two or more scanning operations at different scanning resolutions, wherein a first scanning operation comprises scanning at a first resolution to obtain a preview image, and a second scanning operation comprises scanning at a second resolution higher than the first resolution to obtain a high resolution image; a user interface configured to display said preview" image, wherein said user interface comprises a component for selecting a portion of said preview image and a component for selecting

an output resolution during the second scanning operation; and a processor configured to operate on said high resolution image to generate an output image corresponding to said portion of the preview image and said output resolution.

Therefore, claims 1-6, 8-19, 24-25, 27-35, are Allowed for the reasons the claimed invention are distinct from the prior art searched and of record neither anticipates nor suggests the claimed invention alone in combination as amended.
